## Summary

AI & Automation Professional with 3+ years across data and AI roles, combining analytical depth with software engineering to address complex operational problems. Focused on Python-based automation, API integrations, and agentic workflows that connect enterprise systems. Applies RAG, structured tool calling, and systematic evaluation to solution design, with attention to human oversight, reliability, and measurable business value. Brings a process-improvement mindset to identifying automation opportunities, defining success criteria, and designing maintainable solutions around user needs.

## Professional Experience

### Data Scientist, CyberdomeUSA

08/2025 – Present | Indiana, USA

- Automated onboarding through Python and n8n workflows that validated 200 intake records monthly, created CRM tasks, and escalated missing information; reduced manual handling from 12 to 7 minutes per record, including exception review.
- Engineered REST API and Microsoft Graph integrations between Microsoft 365, CRM, and support systems, using OAuth 2.0, webhook event IDs, and idempotency checks to synchronize updates while preventing duplicate records on replay.
- Built a RAG support workflow using Qdrant, achieving reviewer approval for 85 of 100 held-out responses, with cited guidance, approval controls for account changes, and escalation paths for unsupported requests.
- Automated request classification using Copilot Studio and Power Automate, extracting mailbox data into SharePoint, validating required fields, and routing cases by category while flagging ambiguous submissions for staff review.
- Deployed containerized FastAPI services on Amazon ECS through GitHub Actions, adding integration tests, CloudWatch logs, failure alerts, and replay controls to recover interrupted workflows without duplicating completed updates.

### Applied AI Analyst (Contract), Matrices

09/2025 – 03/2026 | Remote, SF, USA

- Designed stateful Python and LangGraph agents that decomposed requests into tool-driven steps, retained context, and paused for clarification or approval, achieving 85% completion across 100 held-out scenarios evaluated against final record states.
- Implemented Model Context Protocol (MCP) tools for knowledge retrieval and task updates, combining Pydantic validation, access permissions, and action logs to evaluate tool inputs and trace changes to originating requests.
- Developed agent evaluations combining deterministic record checks and human-reviewed scoring, identifying 8 distinct defects across tool selection, approval handling, and retries before releases, with documented failure categories for remediation.
- Instrumented agent workflows with step-level traces, latency, and token-cost tracking, using failed executions to refine routing, retry limits, and fallback behavior while documenting recovery procedures for engineering teams.

### Graduate Assistant, The University of Texas at Arlington

03/2024 – 07/2025 | Texas, USA

- Supported academic teams with Python and SQL scripts validating datasets, identifying missing fields and inconsistent identifiers, and generating descriptive summaries, with documented execution steps for repeatable analysis and reporting.
- Configured Power Automate and SharePoint workflows to track academic submissions, request missing materials, and notify coordinators of deadlines, incorporating staff feedback to refine reminder timing and submission-status reporting rules.
- Developed a Streamlit interface used by 6 academic staff during a pilot to upload datasets, review validation results, and download summary reports, reducing reliance on manually executed Python notebooks.

### Data Scientist, CrystalVox Limited

12/2020 – 12/2022 | Gujarat, India

- Automated reconciliation of 2,000 monthly payment records using Python and SQL, identifying unmatched transactions and generating exception reports; reduced manual review from 5 to 3 hours per 500-record batch.
- Developed Tesseract OCR extraction for provider identifiers and service dates, achieving 90% field-level exact-match accuracy across 200 held-out forms before correction, with validation rules routing uncertain entries for review.
- Implemented SQL credentialing checks to identify expiring provider records and missing documents, automating renewal reminders and maintaining status summaries so operations teams could prioritize requirements across clients.
- Standardized healthcare data transfers using Python validation, scheduled jobs, and batch logs, checking required fields and duplicates while summarizing rejected records for operations teams to investigate and safely reprocess.
- Developed a scikit-learn classifier for billing correspondence, achieving 92% precision at 60% automated-routing coverage across 500 held-out messages, routing payer requests by category and escalating uncertain predictions for review.

## Technical Skills

- Programming & APIs:** Python, SQL, JavaScript, Bash, FastAPI, Pydantic, REST APIs, Webhooks, OAuth 2.0
- Workflow Automation:** n8n, Microsoft Copilot Studio, Power Automate, Apache Airflow, Microsoft Graph API, SharePoint, CRM Integration, Process Mapping, Event-Driven Workflows, Exception Handling
- AI & Agentic Systems:** LangGraph, LangChain, LLM APIs, RAG, Embeddings, Vector Search (Qdrant), MCP, Tool Calling, Structured Outputs, Prompt Engineering, Agent Evaluation, Guardrails, Human-in-the-Loop
- Data & Applications:** PostgreSQL, MySQL, MongoDB, Redis, pandas, scikit-learn, OCR, Data Validation, Streamlit
- Cloud & Reliability:** AWS, Azure, Docker, Git, GitHub Actions, CI/CD, pytest, API Testing, Logging, Monitoring, Audit Trails

## Education

Master of Science, University of Texas at Arlington

08/2023 - 05/2025 | Texas, USA

Computer Science | Specialty: Data Science

Bachelor of Technology, Gujarat Technological University

07/2019 - 07/2023 | Gujarat, India

Information & Communication Technology | Specialty: AI/ML
